

A photograph of a container terminal. In the foreground, a large red container is being loaded onto a truck. In the background, a long line of trucks is waiting at a gate, and several large gantry cranes are visible against a clear blue sky.

SMARTACCESS

Container terminals are essential nodes in the global supply chain and one of the most important performance measures for a terminal is the delivery time of a container to a customer. Long queues at terminal gates and yards lead to increased turn times of trucks affecting the truck delay and delivery to customers.

SmartAccess

Turn around the truck turn time at your terminal with **SmartAccess** - the community access portal by Navis.

SmartAccess enables third party users at your terminal such as trucking dispatchers, truckers, shipping lines, and consignees, to efficiently process and optimize gate operations. Designed to be deployed on a standalone web server outside of N4,

SmartAccess accesses data from N4 so your users can perform specific actions that include:

- Check terminal busyness, confirm availability, schedule and manage appointments.
- Review jobs, run reports, receive electronic EIRs.
- Verify container availability, including customs/agriculture holds, fees due, and free days.

The SmartAccess **Dashboard**

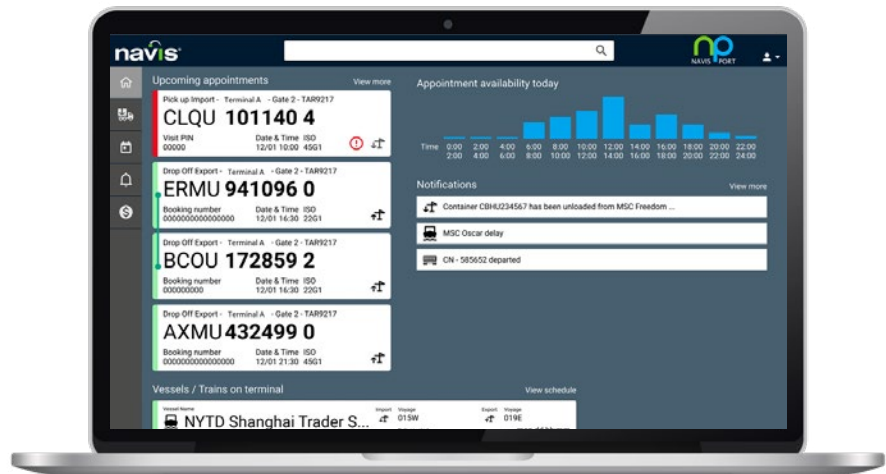

The SmartAccess dashboard provides intuitive and easy to use interface.

At a glance, you can view Upcoming Appointments, Appointment Availability, Vessel/Trains on Terminal, and a list of Notifications.

To maximize the gate efficiency at your terminal, pair SmartAccess with Navis' Terminal Visits mobile application which allows drivers to view, manage, and execute their gate appointments.

Prerequisites

Gate Option, Appointments Option (if appointments are used)
